## Company Overview

Trigger.dev was founded in 2022 as an open-source startup. It provides a background jobs and automation framework specifically for JavaScript and TypeScript. This framework is designed to assist developers in automating workflows such as emails, notifications, and API synchronizations, seamlessly integrating into Node.js applications.

## What Trigger.dev Does

Trigger.dev is capable of running background jobs directly within applications. It supports event-driven workflows and effectively handles scheduling, retries, and long-running tasks. Additionally, it provides integrations with popular APIs, including Slack, GitHub, and SendGrid, all while being developer-friendly through its TypeScript SDK.

# INNOVATEX HACKATHON

## Current Problems

### UI Dashboard Issues

Limited visual clarity regarding job status.

The current UI is not beginner-friendly, which can deter new users.

The lack of a drag-and-drop workflow builder makes it less intuitive.

# Suggested Improvements

To address the current challenges, we propose the following improvements:

## Interactive Dashboard:

- Introduce a graphical workflow builder that utilizes drag-and-drop functionalities.
- Implement a color-coded job status system to indicate success, failure, and pending tasks.
- Provide real-time logs with search capabilities for better troubleshooting.

## Onboarding Experience:

- Develop a step-by-step guided setup process to assist new users.
- Create pre-built workflow templates for common tasks like email notifications, Slack bots, and GitHub synchronization.

## Scalability & Integrations:

- Support for multi-language SDKs, including Python and Go.
- Expand integrations to include services such as AWS, GCP, databases, and payment APIs.

## Community Growth:

- Provide tutorials, organize hackathons, and strengthen documentation to foster a robust community.

# Before vs After

# 1 Current State

The workflow setup is currently text/code heavy, which can be intimidating for users.

## 2 Future Vision

Transition to a visual workflow editor that incorporates drag-and-drop features, nodes, and arrows for a more intuitive user experience.

# Conclusion

In conclusion, Trigger.dev represents a promising open-source framework. However, its main challenge lies in the current UI not being very user-friendly. By implementing better dashboard features and workflow visualization, Trigger.dev has the potential for rapid growth. Our proposal aims to enhance user adoption, facilitate easier debugging, and ensure scalable use for a broader audience.
